# pulsonic P4

## Read-out menu

A heating, water, gas or electricity meter has been installed in your home, which we read out via a pulse counter, called the pulsonic P4. Every time you use energy or water, the pulsonic registers this with pulses (ticks). We convert these pulses into consumption in our system..

### Converting pulses to consumption.

The factor for converting pulses to consumption depends on the type of meter present in your home. For example, a pulse for a water meter can be 1, 10 or 100 liters. And a pulse for an electricity meter can be 1 kWh, 10 kWh or 1 MWh. Which factor applies to your meter is usually shown on the meter.

### How to read out the pulsonic.

The pulsonic has a green button. By briefly pressing this button (2 seconds), you will first see some numbers and symbols in the display. This is a test program. By pressing the button again, you will be shown the number of pulses to date. Each time you press the button again, you will see the data as indicated in the menu on the right.
